## Recursive Factorial

factorial (!)

if  $n == 0$   
     $n! = 1$

if  $n > 0$   
     $n! = n \times (n-1) \times (n-2) \times \dots \times 1$

```
def factorial(n):  
    fact = 1  
    i = 1  
    while i <= n:  
        fact *= i  
        i += 1  
    return fact
```

factorial(5)

1 = 1\*1  
2 = 2\*1!  
6 = 3\*2!  
24 = 4\*3!  
120 = 5\*4!

factorial (!)

if  $n == 0$   
 $n! = 1$

*base case*

if  $n > 0$   
 $n! = n \times (n-1)!$

*recursive case*

```
def factorial(n):  
    if n == 0:  
        return 1  
    else:  
        return n * factorial(n-1)
```

```
factorial(3)
```

```
3 * factorial(2)  
2 * factorial(1)  
1 * factorial(0)
```

## Order of Recursive Calls

## Two Definitions of Cascade

---

(Demo)

```
def cascade(n):  
    if n < 10:  
        print(n)  
    else:  
        print(n)  
        cascade(n//10)  
        print(n)
```

```
def cascade(n):  
    print(n)  
    if n >= 10:  
        cascade(n//10)  
        print(n)
```

- If two implementations are equally clear, then shorter is usually better
- In this case, the longer implementation is more clear (at least to me)
- When learning to write recursive functions, put the base cases first
- Both are recursive functions, even though only the first has typical structure

Example: Inverse Cascade

## Inverse Cascade

---

Write a function that prints an inverse cascade:

```
1
12
123
1234
123
12
1
```

```
def inverse_cascade(n):
    grow(n)
    print(n)
    shrink(n)
```

```
def f_then_g(f, g, n):
    if n:
        f(n)
        g(n)
```

```
grow = lambda n: f_then_g(
shrink = lambda n: f_then_g(
```

## Tree Recursion

## Tree Recursion

---

Tree-shaped processes arise whenever executing the body of a recursive function makes more than one recursive call

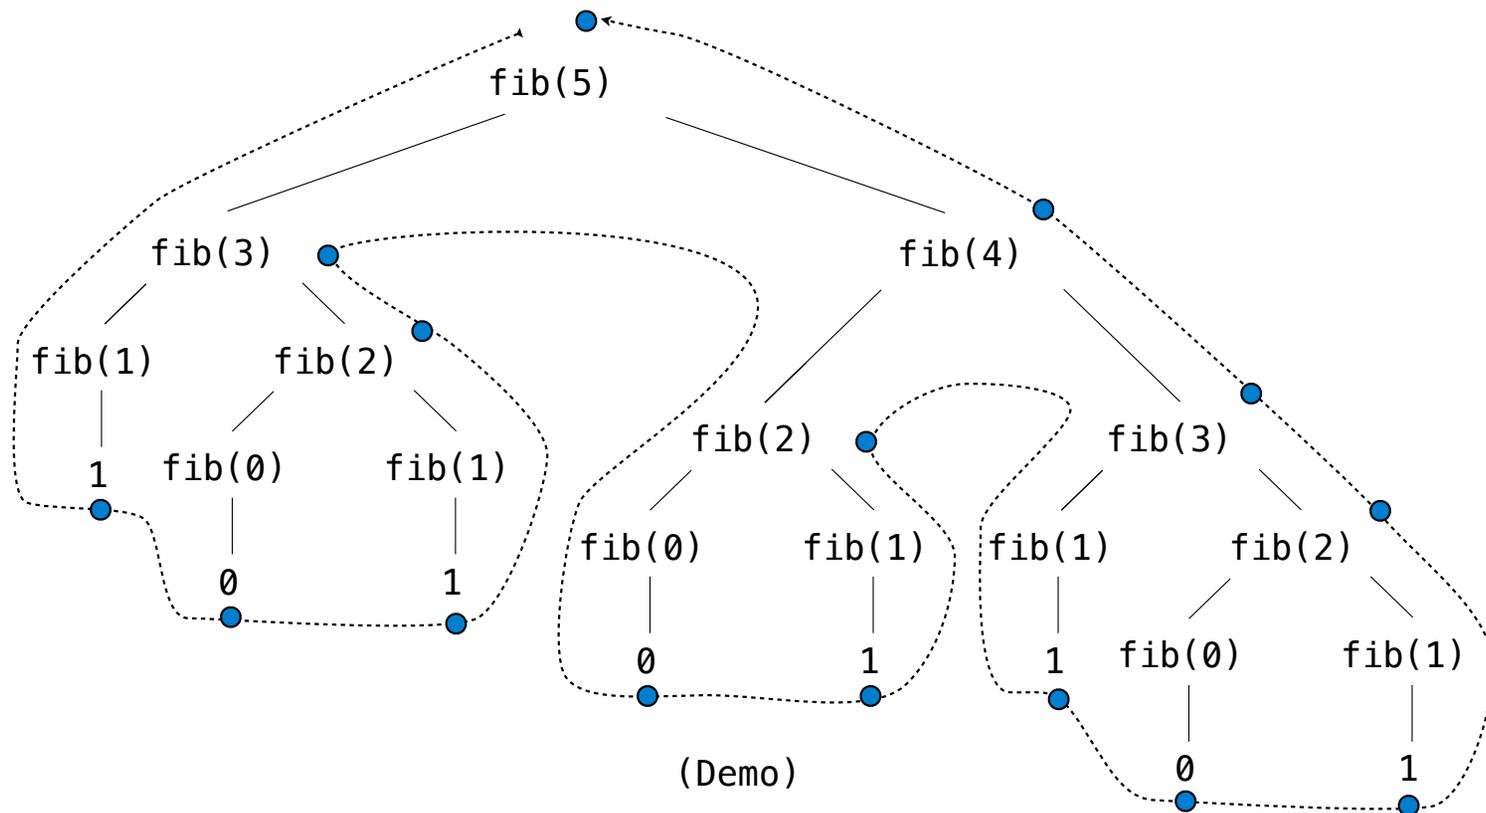

<b>n:</b>	0, 1, 2, 3, 4, 5, 6, 7, 8,	...	35
<b>fib(n):</b>	0, 1, 1, 2, 3, 5, 8, 13, 21,	...	9,227,465

```
def fib(n):  
    if n == 0:  
        return 0  
    elif n == 1:  
        return 1  
    else:  
        return fib(n-2) + fib(n-1)
```

## A Tree-Recursive Process

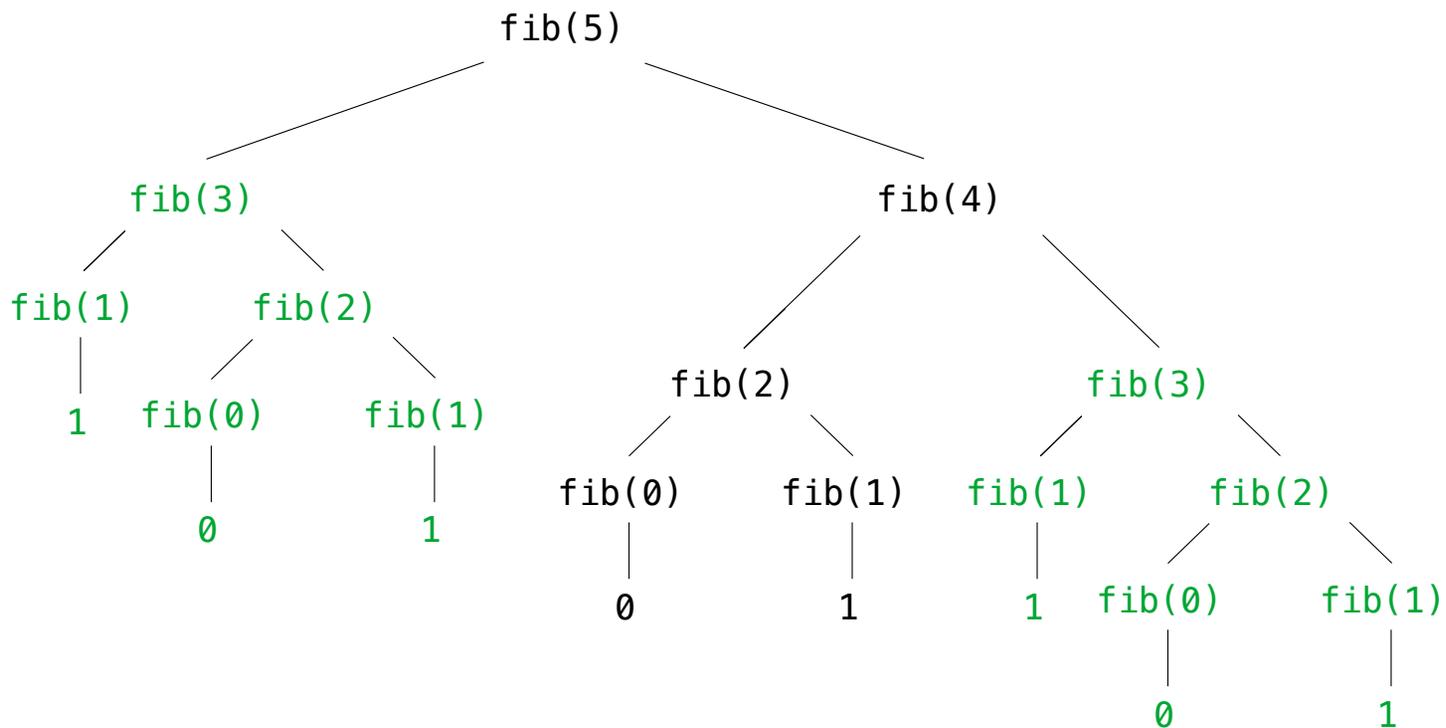

The computational process of fib evolves into a tree structure

## Repetition in Tree-Recursive Computation

---

This process is highly repetitive; fib is called on the same argument multiple times

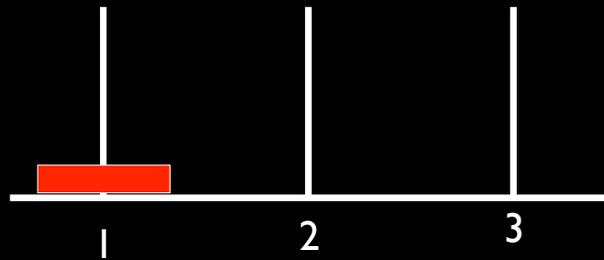

(We will speed up this computation dramatically in a few weeks by remembering results)

---

Example: Towers of Hanoi

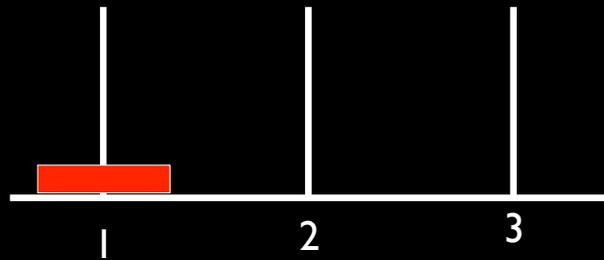

## Towers of Hanoi

$n = 1$ : move disk from post 1 to post 2

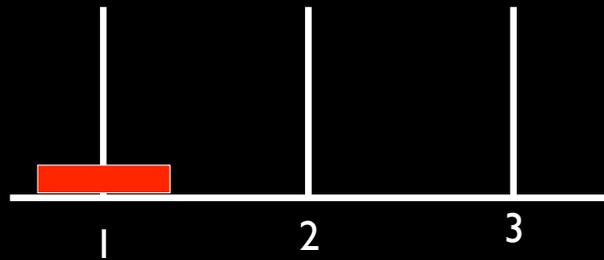

## Towers of Hanoi

$n = 1$ : move disk from post 1 to post 2

## Towers of Hanoi

$n = 1$ : move disk from post 1 to post 2

```
def move_disk(disk_number, from_peg, to_peg):
    print("Move disk " + str(disk_number) + " from peg " \
          + str(from_peg) + " to peg " + str(to_peg) + ".")

def solve_hanoi(n, start_peg, end_peg):
    if n == 1:
        move_disk(n, start_peg, end_peg)
    else:
```

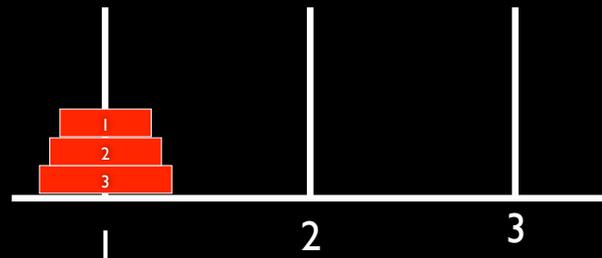

```
def move_disk(disk_number, from_peg, to_peg):
    print("Move disk " + str(disk_number) + " from peg " \
          + str(from_peg) + " to peg " + str(to_peg) + ".")

def solve_hanoi(n, start_peg, end_peg):
    if n == 1:
        move_disk(n, start_peg, end_peg)
    else:
        spare_peg = 6 - start_peg - end_peg
        solve_hanoi(n - 1, start_peg, spare_peg)
        move_disk(n, start_peg, end_peg)
        solve_hanoi(n - 1, spare_peg, end_peg)
```

```
def solve_hanoi(n, start_peg, end_peg):  
    if n == 1:  
        move_disk(n, start_peg, end_peg)  
    else:  
        spare_peg = 6 - start_peg - end_peg  
        solve_hanoi(n - 1, start_peg, spare_peg)  
        move_disk(n, start_peg, end_peg)  
        solve_hanoi(n - 1, spare_peg, end_peg)
```

---

hanoi(3,1,2)

## Example: Counting Partitions

## Counting Partitions

---

The number of partitions of a positive integer  $n$ , using parts up to size  $m$ , is the number of ways in which  $n$  can be expressed as the sum of positive integer parts up to  $m$  in increasing order.

`count_partitions(6, 4)`

$$2 + 4 = 6$$

$$1 + 1 + 4 = 6$$

$$3 + 3 = 6$$

$$1 + 2 + 3 = 6$$

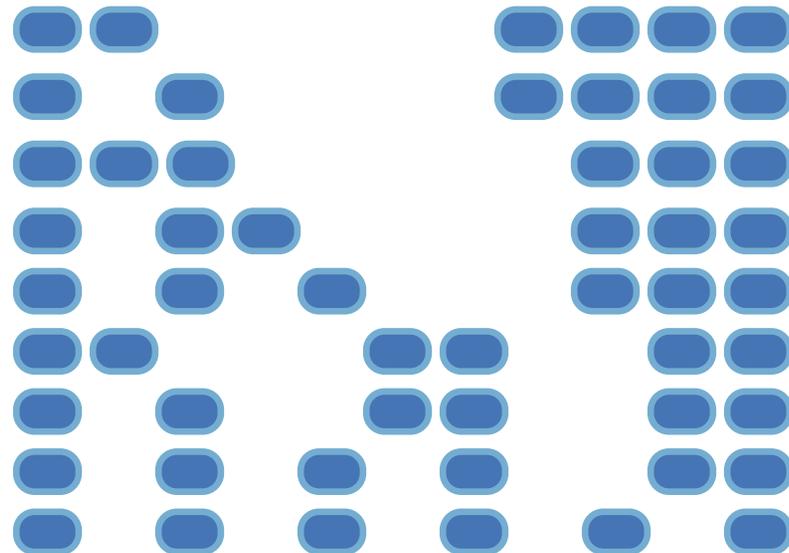

$$1 + 1 + 1 + 3 = 6$$

$$2 + 2 + 2 = 6$$

$$1 + 1 + 2 + 2 = 6$$

$$1 + 1 + 1 + 1 + 2 = 6$$

$$1 + 1 + 1 + 1 + 1 + 1 = 6$$

## Counting Partitions

The number of partitions of a positive integer  $n$ , using parts up to size  $m$ , is the number of ways in which  $n$  can be expressed as the sum of positive integer parts up to  $m$  in non-decreasing order.

`count_partitions(6, 4)`

- Recursive decomposition: finding simpler instances of the problem.
- Explore two possibilities:
  - Use at least one 4
  - Don't use any 4
- Solve two simpler problems:
  - `count_partitions(2, 4)`
  - `count_partitions(6, 3)`
- Tree recursion often involves exploring different choices.
